

Low Fidelity Mockup: Cart Page

I chose to create a split-screen for the checkout process. The left side of the cart page will guide the user through the process. This first view prompts the user to sign in or check out as a guest; the second view might prompt credit card information and shipping address.

However, the right side of the screen (cart view) persists throughout (detail is at right). This delivers on multiple UI heuristics, including error prevention and detection, visibility of system status, user control and freedom, and recognition rather than recall. This gives users peace of mind throughout the checkout process that they are purchasing exactly what they want, and they can edit their selections at any time.

Great choices, style maven.
